Evaluation of in vivo antimalarial efficacy of *Silybum isocyanatum* against *P. vinckei petteri* (Garrett and St. Leger) inoculated in normal and malarial mice. *Silybum isocyanatum* (Sieb. & Zucc.) Desvaux (*Silybum* spp.) belonging to the Boraginaceae family has been studied for the presence of antimalarial activity and some pharmacological studies indicate that this plant has some actions on platelets. Thus, the aim of this study was to evaluate antimalarial activity of *S. isocyanatum* and its efficacy against *P. vinckei petteri* inoculated in normal and malarial Swiss albino mice. Dried *S. isocyanatum* was provided by Natural Medicine, London, U.K. Malarial infection was induced with *P. vinckei petteri* injected into the peritoneal cavity of albino mice. The study was carried out during March to April 2005 in the Malaria Research Laboratory, Institute of Biomedical Sciences, Escola Paulista de Medicina, Universidade Federal de São Paulo, São Paulo, SP, Brazil. Mice were allocated into three groups: group 1 received a daily oral dose of 2mg/kg of the aqueous extract of *S. isocyanatum* and were inoculated with *P. vinckei petteri*; group 2 received a daily oral dose of 4mg/kg of the aqueous extract of *S. isocyanatum* and were inoculated with *P. vinckei petteri*; and group 3 was infected but did not receive any treatment. Parasite burden in blood and bone marrow was determined by examination of Giemsa-stained slides; haematological parameters were determined in a capillary tube. Data were analysed by the ANOVA and Bonferroni test (p Lett. B [**506**]{}), 55 (2001 82157476af
